

addLogix EchoView MA-WL-DVI

Wireless Video Adapter

EchoView, Addlogix's compact Wireless Video Adapter is compatible with all Mitsubishi line of projectors. Compatible with wireless (IEEE 802.11 b/g) computers, **EchoView** revolutionizes how projectors are used. The adapter connects to a projector's VGA or DVI port and enables a computer to display to the projector without a cable. Presenters no longer are limited by the cable length from the computer to the projector.

Sharing **EchoView** among users is straight forward. To allow the second user to gain access to the projector, the first user simply click on the "Stop Projection" button. The second user then can gain access to the projector by launching the software application.

CD-less Driver Download and Installation

Unlike any product in the market, **EchoView** allows first time installation to be completed in just seconds. When powered on, the unit will show up as an available wireless network connection on the computer's network setting. A user simply clicks on the connection to initiate communication to the adapter. Upon user's confirmation, the software driver will then be automatically downloaded and installed to the computer via the wireless network. To send video to the unit and the projector, the user simply launches the driver application by double clicking on the driver icon. There's no need to set up IP address, DHCP settings, etc.

Convenient Software Features

The main menu of **EchoView** software application has several productive features such as freeze, Hide, Stop Projecting, and Select Projector.

add logix

"Freeze" the last frame of the transmitted video.

Turn the display into a black screen. This brings audience's attention to the presenter.

Ends the wireless video transmission. Allows another user to gain access to EchoView and the video display.

Choose the EchoView unit to connect to (when more than one units are available).
